2014 RABIES ANNUAL SUMMARY

Wadsworth Center Rabies Laboratory

New York State Department of Health

Robert J. Rudd

There were 372 animals diagnosed with rabies at the Wadsworth Center Laboratory in 2014, representing 5.5% of all animals tested (see Table 1). The 372 rabid animals includes 166 raccoons (23.6 % positivity rate); 45 skunks (20.6%); 98 bats (2.9%); 18 gray fox (39.1%); 25 cats (2.2%); 5 bovine (5.8%); 6 red fox (8.7%); 4 woodchucks (4.9%); 1 bobcat (50%); 1 coyote (12.5%); 1 horse (2.0%); 1 beaver (33.3%) and 1 sheep (6.3%).

The Wadsworth Center's Rabies Laboratory tested 6,710 animals in 2014. This number is 1021 greater than tested in 2013. In 2014 terrestrial and bat rabies were reported in 52 and 26 counties respectfully. During 2013, 48 counties submitted rabies positive terrestrial animals and 32 counties submitted rabies positive bats.

The specimens tested included 4,727 wild animals (70.4% of total submissions and 91.4 % of positives) and 1,984 domestic animals (29.5% of total specimens and 8.6% of positives), with 49 species of animals represented. These included 3,380 bats (53.3% of all animals tested), 1,134 cats (17.9%), 660 dogs (10.4 %), 702 raccoons (11.0%), 218 skunks (3.4%), 84 other wild (1.3%), 65 deer (1.0%), 156 rodents and lagomorphs (2.4%), 115 fox (1.8%), 86 cattle (1.3%), 56 other domestic (0.9%) and 48 equine (0.75%).

Rabies virus infection was present in 2.9% of all bats submitted in 2014. There were 3,239 big brown bats examined and 93 of those were rabid, resulting in a 2.9% positivity rate for that species. Rabies was detected in 1 of 68 little brown bats examined (1.5 % positivity), 0 of 1 tri-colored bat (*Perimyotis subflavus* formerly known as the Eastern Pipistrelle), 2 of 23 (8.7%) silver-haired bats, 0 of 20 red bats, and 2 of 4 hoary bats (50.0%). Of the 98 rabid bats tested in 2013, 43 (44%) had reported contacts with humans and/or domestic animals. However, of the 3,380 bats tested, 1,857 (54.9%) had contact with humans and were found to be negative for rabies. This testing prevented unnecessary post exposure prophylaxis and conserved the costly and limited supply of rabies vaccine and immune globulin.

In 2013 a marked reduction in the submission of big brown bats was noticed. In that year the Rabies Diagnostic Laboratory tested 778 fewer big brown bats than the previous year. Information from colleagues at the Department of Environmental Conservation and from Wildlife Rehabilitators noted a high mortality to newborn bat pups during 2013. This, in part, may be the result of the excessive heat that coincided with parturition in colonial bats during May-June, 2013. In 2014 the submission of big brown bats for rabies diagnosis rebounded and was recorded as the third highest number of this taxa submitted in any one year (see Table 2).

Of concern over the past seven years is the disease affecting bats known as White Nose Syndrome. This disease predominantly affects bats of the genus *Myotis*. From 1999 – 2008, the rabies lab tested an average of 952 little brown bats per year. In 2009 that number dropped to 483, and in 2010 the rabies lab tested 245 little brown bats. The laboratory tested 174 *Myotis* in 2011; 167 *Myotis* in 2012 and 105 *Myotis* in 2013. In 2014 the rabies diagnostic laboratory tested 68 little brown bats. This drop in *Myotis* submissions for rabies testing is evidence of the steep decline in the number of these bats found in New York State (see Table 2).

During 2014 the Rabies Diagnostic Laboratory at the New York City Department of Health and Mental Hygiene examined 402 specimens, including 159 raccoons, 91 cats, 38 dogs, 68 opossums, 29 bats, 7 skunks, 3 groundhogs, 4 squirrels, 1 gopher, 1 mouse and 1 rabbit. Among these animals 12 (3.0%) were positive for rabies, including 10 raccoons, 1 skunks, and 1 opossum.

The Wadsworth Center rabies laboratory tested 885 human sera for rabies virus neutralizing antibody. The laboratory also examined 8,486 raccoon sera for rabies antibody in support of wildlife oral rabies vaccination programs.

Rabies virus-variant typing was performed on 89 isolates using a panel of monoclonal antibodies or real-time PCR to aid in the study of rabies epizootiology in the State.
